TITLE: Determination of thermo-physical properties of a
titanium alloy 48-OT-3 (48-OT-3)

PERIODICAL: Tsvetnyye metally, 1961, No.8, pp. 73-79

TEXT: Knowledge of the thermo-physical properties of metals
and alloys is necessary in selecting both the rational heating
schedules during various fabrication processes and the optimum
operating conditions for components subjected to variations in the
ambient temperature. The object of the present investigation was
to determine the thermal conductivity (λ , kcal/m h °C), specific
heat (C , kcal/kg °C), and the thermal diffusivity (a , mm²/h)
($a = \lambda/C\gamma$, where γ is the density of the material) of the
48-OT-3 Ti-base alloy. This alloy contained 3.5-4.0% Al, not more
than 0.1% nitrogen, 0.1% oxygen and traces of hydrogen. The
measurements were carried out at temperatures ranging from 100 to
1025 °C. The magnitude of a and C only was determined;
Card 1/9

Determination of thermo-physical ...

25937
S/136/61/000/008/005/005
E193/E135

λ was calculated from these data ($\lambda = aC\gamma$), the appropriate correction being applied for the thermal expansion of the alloy. The bulk of the paper is devoted to a detailed description of the experimental technique and equipment used. A technique developed by N.Yu. Tayts and E.M. Gol'dfarb (Ref.2: Zavodskaya laboratoriya, 1950, No.3) and based on a method proposed by G.M. Kondrat'yev (Ref.1: Teplovyye izmeneniya (book "Thermal Changes"), Mashgiz, 1957) was used by the present authors for the determination of a . The method consists in solving the differential equation of the thermal diffusivity for a slab heated at a constant rate. If the temperature gradient between the surface and the axis of a cylindrical slab at the initial moment is Δt_0 , then

$$\frac{\Delta t}{v \tau} = \frac{R^2}{4a \tau} - \left(\frac{R^2}{a \tau} - \frac{4 \Delta t_0}{v \tau} \right) \Phi \left(\frac{a \tau}{R^2} \right) \quad (1)$$

where: v is the constant heating rate ($^{\circ}\text{C/h}$); τ is the time (h); a is the thermal diffusivity (mm^2/h); and $\Phi(a\tau/R^2)$ is the function of the Fourier criterion. In practice, this method consists in measuring the temperature on the surface and in the

Card 2/ 9

Determination of thermo-physical

25937
S/136/61/000/008/005/005
E193/E135

interior of a specimen (cylindrical in the present case), heated at a constant rate in a specially designed furnace with low thermal inertia. From the measured temperature gradient at the beginning and end of each heating interval, and from the known heating rate, $\Delta t_0/vt$ and $\Delta t/vt$ are calculated, after which the average value of α is determined. The advantage of this method consists in that the formulae employed do not depend on the external heat transfer conditions. The method used in the present investigation for determining C is based on the principle of heat balance and has been developed by "Gintsvetmet". It is best described with reference to Fig.4, which shows the experimental assembly comprising the following items: 1, the material tested; 2 and 3, screening vessel and its lid; 4, electric furnace; 5, furnace cover; 6, portable potentiometer; 7, resistance box; 8, step-down transformer; 9, mirror galvanometer; T_0 , thermocouple measuring the temperature at the specimen axis; T_c and T_n , differential thermocouple housed in the screening vessel wall. A constant quantity of heat per unit time is supplied to the specimen, and the temperature t_0 at the specimen axis is measured as well as the temperature gradient, Δt , across the screening vessel wall.

Card 3/9

Determination of thermo-physical

25937
S/136/61/000/008/005/005
E193/E135

When the temperature at the specimen axis is raised from zero to t °C, the heat balance is described by:

$$\left(F \frac{\lambda}{s} \rho \right) \Delta t_1 z_1 = q_{ak} + i_1 w_1 \quad (3)$$

where: F is the surface area (m^2) of the screening vessel through which heat is conducted; λ is the thermal conductivity coefficient of the screening vessel material ($cal/m^2 h$ °C); s is the screening vessel wall thickness (m); ρ is a correction factor taking into account the fact that heat flows not through a flat surface but through a cylindrical wall and a lid; Δt_1 is the average temperature gradient across the screening vessel wall (°C); z_1 is the time (h) required to raise the temperature in the centre of the crucible from zero to t °C; q_{ak} is the heat ($kcal$) accumulated in the screening vessel in the time z_1 ; i_1 is the heat content ($kcal/kg$) of the specimen at t °C; and w_1 is the weight of the specimen (kg). The experiment is repeated three times: twice on a standard material with a known heat content, specimens of different weight (w_1 and w_2) being used each time, and

Card 4/9

25937

S/136/61/000/008/005/005

Determination of thermo-physical ...

E193/E135

once on the material studied, the weight of the test piece in this case being w_3 . Three heat balance equations are obtained in this manner for each of the temperature intervals selected, and from these the formula for the heat content of the material studied is derived in the form of:

$$i_3 = \frac{i_2 w_2 - i_1 w_1}{w_3} \left(\frac{\Delta t_3 z_3 - \Delta t_1 z_1}{t_2 z_2 - t_1 z_1} \right) + \frac{i_1 w_1}{w_3} \quad (4)$$

Since it was found that the temperature-dependence of heat content of copper was not linear, nickel was used as the standard material in the present investigation. The results of the measurements of thermal diffusivity of the 48-OT-3 alloy are given in Table 1, under the following headings: 1) alloy temperature, °C; 2) a , m^2/h . The results of the specific heat measurements are tabulated and also reproduced graphically in Fig.6, where the specific heat C (kcal/kg °C) is plotted against the temperature (°C), curve 1 showing the actual C at a given temperature, and curve 2 showing the average C for any 20 °C to t_0 temperature interval. Finally,

Card 5/9

25937

S/136/61/000/008/005/005

E193/E135

Determination of thermo-physical

the data on thermal conductivity, calculated from $\lambda = \alpha \gamma$, are given in Table 2 under the following headings: 1) temperature, °C; 2) λ , kcal/m h °C. The investigation was directed by Doctor of Technical Sciences D.I. Starchenko. There are 6 figures, 3 tables and 3 Soviet references.

TITLE: Preliminary results of a study of motions of small-scale inhomogeneities in the lower ionosphere at the coastal line of the Black Sea

SOURCE: AN UkrSSR. Mezhdovedomstvennyy geofizicheskiy komitet. Informatsionnyy byulleten', no. 9, 1966. Geofizika i astronomiya, 130-133

TOPIC TAGS: ionosphere, E layer, F layer, seasonal variation, ionospheric drift, sea coast

ABSTRACT: Drifts of small-scale inhomogeneities in the ionosphere layers E, E_s, and F were measured in 1964 in the region of coastal thermal contrasts by impulse sounding. The standard frequency of 2.2 Mc and for the E layer as well as frequencies close to critical values were used. Harmonic analysis of the results indicated seasonal and local drifts in the lower layers of the ionosphere and regularity of north-east and north-west transport in both E and E_s during summer and winter, respectively. Seasonal regularity is less developed in layer F and the diurnal component of drifts is prevailing. The data were also analyzed by a similarity method. Orig. art. has: 2 figures.

The bitumen from shale of the Godovsk region. N. M. Karavaev, I. M. Vener, and A. V. Karnazeva. *Trudy Inst. Geol. Akad. Nauk S.S.S.R.* 2, 285-95 (1960). The bitumen obtained from Godovsk shale is a high-mol. material contg. phenols, ketones, and pyridines. The bitumen reacts with $AlCl_3$ to form alkali-sol. products which contain phenols. Acid hydrolysis yields low-mol. phenols (av. compn. $C_{11}H_{10}O$) and pyridine bases. Oxidation with alk. $KMnO_4$ yields only fatty acids. In spite of the presence of OH groups in the bitumen, only insignificant amounts of H_2O are formed on thermal decomposition, indicating the absence of alk. groups. The O of the bitumen is present in the form of CO_2 , CO, and OH groups or in forms not as yet established. J. Rovtar Leach

KARNEVICHEVA L V

Parchment paper from chemically refined kraft pulp.
L. V. Karneicheva (2nd Paper Plant, Leningrad). *Bumash*,
Prm. 30, No. 10, 23(1955).—Kraft pulp, 6.3–7.2° Björk-
man, 0.5% ash, 8046–8700 m. breaking length, 1230–1640
double folds, 83.2–8.5% α -cellulose, 1.22–1.33 Cu no., and
a viscosity of 180 millipoises (mp.) (cuprammonium soln.)
was chemically refined by treatment with 8% NaOH (based
on bone-dry fiber wt.), 90°, and 13% consistency, washed,
bleached at pH 10, 38°, 3% consistency, 3% consumption of
active Cl, washed, and acidified (0.1% H₂SO₄ based on bone-
dry fiber wt.), and washed to neutral, to give a pulp with
83.8–8.4% α -cellulose, a viscosity of 127 mp., 0.34% ash,
and a Cu no. of 0.3. A satisfactory parchment paper was
prepd. by beating rag stock (50% of parchment paper fur-
nish) at 2.3–2.4% consistency to 38–32° Schopper-Riegler,
adding the chemically refined, bleached kraft, and beating
at 3.5–4% consistency to 40–3° S. R. J. L. KAY

"Mikrobiologiya" Vol XVII, No 6

Cells of *Cl. Welchii*, attenuated by heating to sublethal temperature, lose their dehydrogenating activity for carbohydrates, certain acids, and lecithin. They retain it for ascorbic acid and certain amino acids. The attenuated forms may regain their ability to dehydrogenate certain carbohydrates by adapting themselves to media in which hydrogen transfer occurs readily (media with low oxidation-reduction potential). Gives composition of culture media for growing cells of *Cl. Welchii* attenuated by heating.

TITLE:

The Second All-Union Conference on Radioelectronics of the Ministry of Higher Education of the USSR (Vostochnyye Vsesoyuznaya konferentsiya VVO SSSR po radioelektronike - News item

PERIODICAL:

Radioelektronika i Elektronika

ABSTRACT:

The conference took place during September 25 - 29, 1957, at Saratovskiy gosudarstvennyy universitet imeni N.G. Chernyshevskogo (Saratov State University named after N.G. Chernyshevsky). Apart from the university itself, the conference was attended by the representatives of the scientific research institutes of the Soviet and of some Ukrainian Academies of Sciences, various industrial establishments and the interested ministries. The papers presented and the discussion and evaluation of plans for the future research carried out by the universities in the field of radioelectronics.

The paper by A.A. Sazonov and G. V. Kiselev, entitled "The Problems of the Statistical Evaluation of the Results of Measurements of the Amplitude of the Rapid Fluctuations of Ultra-Shortwave Radio Signals" aroused considerable interest. Similarly, the paper by A.A. Sazonov and Ch. Ya. Tsydrovskiy, the title "Investigation of the Variations of the Direct Radio Signal Propagation in Non-uniform Troposphere over a Ground Path" was of considerable interest. The latter paper gave some results of an experimental investigation of the fading of the direct wave over a medium-distance ground path. The statistical characteristics of the amplitude fluctuation of the signal were investigated and an attempt was made to clarify the mechanism of the signal variations. During the discussion, the great practical value of the above works was emphasized and it was suggested that the above works be extended in order to attain a greater accuracy. Twelve papers and communications were read at the Semi-conductor Section. L.G. Kershteyn gave an approximate method of calculating the transients in a transistor operating with large signals.

Card 13/16

made of ultra-calcium clay (silicones, etc.). The investigation showed that the samples produced had satisfactory characteristics. The development of non-linear semiconductor devices was described in a paper of V.V. Pavlov. The paper by L.A. Chirkin, "Resistance Elements for Powers of 10-15 W", described and their applications were studied. A method of calculating an inverse peak current in p-n diodes was described in the paper of L.I. Baranov and M.C. Bekbulatov. The paper of M.C. Bekbulatov and L.I. Baranov described the results of the experiments. The paper by Yu. M. Kiselev, K.S. Berestovskiy, L.N. Kaptsov, V.Y. Migulin, A.S. Yan, K.S. Berestovskiy, L.N. Kaptsov and T.N. Vastrebayeva contained a survey of the works dealing with the applications of transistors in various radio circuits. G.M. Berestovskiy read a paper in which he gave the analysis of the operation of a transistor AG-DC converter. The experimental operation of a transistor AG-DC converter was described. The author showed that a high conversion efficiency could be obtained with a number of Soviet transistors. During the conference, a number of trips were arranged to various industrial establishments of the town of Saratov. During the closing plenary session of the conference, on September 28, a unanimous resolution summarizing the work of the conference and expressing recommendations with regard to the subject was adopted. The plans for the future work were adopted. It was also decided that the third All-Union conference of the Ministry of Higher Education of the USSR on radioelectronics would be held in Khar'kov in September, 1959.

TITLE: Caesium-137 in population of Lodz in 1963 and 1964

SOURCE: Nukleonika, v. 10. no. 1, 1965, 35-49

TOPIC TAGS: cesium, radioisotope, radiation biologic effect, potassium,
radiobiology, health

ABSTRACT: The whole-body counter at the Institute of Occupational Medicine in Lodz is described in detail. The in vivo calibration for Cs-137 and for potassium was performed using Cs-132 and K-42 as well as potassium chloride. Details of the calibration procedure are given. Cs-137 body level of adult, professionally non-exposed subjects of both sexes, inhabitants of Lodz was measured four times. In the spring and fall of 1963 and 1964 the Cs-137; potassium ratio was 133, 181, 178, and 200 pC/K, respectively. "The authors wish to thank all Colleagues from the staff of the Institute who took part in the calibration of the counter, and Miss Krystyna Misiak for the technical assistance." Wiesława

TITLE: ⁹⁰Sr contamination of milk, cattle and human bones
in Poland in 1959

PERIODICAL: Nukleonika, v. 6, no. 1, 1961, 57-64

TEXT: This is a continuation of an investigation begun in 1958
(Ref. 1: Liniecki, J., Czosnowska, W and Pietrzak, Z: Nukleonika, 5,
301 (1960) using the same analytical procedures. Cattle bones were
sampled both from the lowland districts (Lublin, Warsaw, Danzig,
Bydgoszcz and Poznań) and the highlands (Zakopane, Limanowa, Jasło
and Pszczyna) the latter being subject to heavy annual rainfall.
Powdered milk came from factories situated in the lowlands (Krośniew-
ice, Siedlce, Rypin, Słupsk and Września) and a few liquid samples
were collected in the Cracow area. Human bones were obtained from
the Pathological Anatomy Department and the Children's Hospital of
the Medical School at Łódź (from the deceased inhabitants of that

Card 1/3

23895

P/046/61/006/001/004/005
D226/D301⁹⁰Sr contamination of milk...

district) and from the Children's Hospital at Cracow. Anterior parts of vertebrae, femurs and tibias were tested. The ⁹⁰Sr content of cattle bones for 1959 are tabulated, and a comparison with figures obtained in 1958, for the lowlands cattle is also illustrated. It is shown that the level of contamination is greater in the highland cattle and decreases with increasing age of the animal, although considerable variations were found. The highest results approximated to 100 $\mu\text{c/g Ca}$, the maximum permissible concentration for human population. Further tests on cattle and sheep are planned. The average ⁹⁰Sr content in powdered milk samples was $7.2 \pm 1.0 \mu\text{c/g Ca}$, the values varying between 3.2 and 14.8, and the corresponding figure for liquid milk was found to be 9.9 (3.6 - 13.3). Seasonal variations of contamination level in milk are shown and future work in this direction is briefly mentioned. Concentrations of ⁹⁰Sr in human bones show that the ⁹⁰Sr content is highest in the 0 - 5 age group and decreases with age, becoming fairly constant in persons over 20. This is in agreement with Western work. Results also for the 0 - 20 age groups are similar to those of Western observers, but the ⁹⁰Sr levels in adult bones are higher than the values measured by Western

"On the Dominant Cause of Individual Variation in Cs¹³⁷ Body Content"

Warsaw, Nukleonika, Vol 11, No 6, 1966, pp 455-458

Abstract: Approximate values of biological half-life of caesium (long-life component) were calculated from the data on body burden and excretion of Cs¹³⁷ in eight young healthy adults, assuming a state of metabolic equilibrium or close to it. Significant correlations between body content and half-life have been found.
The article is printed in English and contains 2 Tables, 2 Figures and 8 references (2 Polish and 6 Western). Received 28 December 1965.

 5170 The effect of the earth's ellipticity on the
 precision of seismological calculations. V. KARNIK.
 Czech. J. Geophys. 10 (1963) 28. English
 summary.
 Outlines the theory of the effect of the earth's
 ellipticity on travel times of seismic waves and gives
 Jeffreys' derivation of the differences between travel
 times through the earth and through a reference
 sphere of equal volume. The methods of applying
 these corrections at the Prague seismological station
 are described.
